## PYRIMIDINE DERIVATIVES AND THEIR USE AS NEUROPEPTIDE Y RECEPTOR LIGANDS

The present invention is concerned with novel pyrimidine derivatives useful as neuropeptide Y (NPY) receptor ligands, particularly neuropeptide Y (NPY) antagonists.

The invention is concerned especially with compounds of formula I

5

I

10  $R^1$  and  $R^2$  are each independently alkyl, cycloalkyl or aralkyl or one of  $R^1$  and  $R^2$  is hydrogen and the other is alkyl, aminoalkyl or cyclopropyl or  $R^1$  and  $R^2$  together with the N atom to which they are attached form a 4- to 10- membered heterocyclic ring optionally substituted with one to three substituents independently selected from alkyl, hydroxy, alkoxy, alkoxyalkyl, hydroxyalkyl or  $\text{CONR}^5\text{R}^6$ ;

15  $R^3$  is alkyl, cycloalkyl, alkoxyalkyl, hydroxyalkyl, haloalkyl, alkoxy, alkoxyalkoxy, hydroxyalkoxyalkyl, hydroxyalkoxy, aralkyl or amino;

$R^4$  is aryl or heteroaryl, wherein  $R^4$  is not nitro-furyl or nitro-thienyl;

and pharmaceutically usable salts and esters thereof.

The compounds of formula I and their pharmaceutically usable salts and esters are novel and have valuable pharmacological properties. They are neuropeptide ligands, for  
5 example neuropeptide receptor antagonists and in particular, they are selective neuropeptides Y Y5 receptor antagonists.

Neuropeptide Y is a 36 amino acid peptide that is widely distributed in the central and peripheral nervous systems. This peptide mediates a number of physiological effects through its various receptor subtypes. Studies in animals have shown that neuropeptide Y  
10 is a powerful stimulus of food intake, and it has been demonstrated that activation of neuropeptide Y Y5 receptors results in hyperphagia and decreased thermogenesis. Therefore compounds that antagonise neuropeptide Y at the Y5 receptor subtype represent an approach to the treatment of eating disorders such as obesity and hyperphagia.

The current approach is aiming at medical intervention to induce weight loss or  
15 prevention of weight gain. This is achieved by interfering with appetite control, which is mediated by the Hypothalamus, an important brain region proven to control food intake. Herein, neuropeptide Y (NPY) has been proven to be one of the strongest central mediators of food intake in several animal species. Increased NPY levels result in profound food intake. Various receptors of neuropeptide Y (NPY) have been described to play a role  
20 in appetite control and weight gain. Interference with these receptors is likely to reduce appetite and consequently weight gain. Reduction and long-term maintenance of body weight can also have beneficial consequences on associated risk factors such as arthritis and diabetes.

Accordingly, the compounds of formula I can be used in the prophylaxis or  
25 treatment of arthritis, diabetes and particularly eating disorders and obesity.

Objects of the present invention are the compounds of formula I and their aforementioned salts and esters per se and their use as therapeutically active substances, a process for the manufacture of the said compounds, intermediates, pharmaceutical compositions, medicaments containing the said compounds, their pharmaceutically usable  
30 salts and esters, the use of the said compounds salts and esters for the prophylaxis and/or therapy of illnesses, especially in the treatment or prophylaxis of arthritis, diabetes and particularly eating disorders such as hyperphagia and particularly obesity, and the use of

the said compounds, salts and esters for the production of medicaments for the treatment or prophylaxis of arthritis, diabetes and particularly eating disorders and obesity.

The term "lipase inhibitor" refers also to polymer bound lipase inhibitors for example described in International Patent Application WO99/34786 (Geltex Pharmaceuticals Inc.). These polymers are characterized in that they have been substituted with one or more groups that inhibit lipases. The term "lipase inhibitor" also comprises pharmaceutically acceptable salts of these compounds. The term "lipase inhibitor" preferably refers to orlistat.

Orlistat is a known compound useful for the control or prevention of obesity and hyperlipidemia. See, U.S. Patent No. 4,598,089, issued July 1, 1986, which also discloses processes for making orlistat and U.S. Patent No. 6,004,996, which discloses appropriate pharmaceutical compositions. Further suitable pharmaceutical compositions are described for example in International Patent Applications WO 00/09122 and WO 00/09123. Additional processes for the preparation of orlistat are disclosed in European Patent Applications Publication Nos. 185,359, 189,577, 443,449, and 524,495.

Processes for the manufacture of compounds of formula I are an object of the  
20 invention.

The substituents and indices used in the following description of the processes have the significance given above unless indicated to the contrary.

Compounds of formula I can be obtained by the following methods:

- According to scheme 1, compounds of general formula II, with Hal meaning chloro or bromo, can be reacted with the corresponding amines in a suited solvent such as methanol, isopropanol or THF - or without solvent - to yield the amino derivatives of general formula III selectively. The compounds of general type III can then be reacted in a
- 5 Pd-catalysed coupling reaction (Heck-type reaction; for a review: M. Beller et al: 'Palladium-catalysed olefination of aryl halides and related transformations', Transition Metals for Organic Synthesis, Vol 1, 1998, Wiley -VCH), with appropriate olefins XI as defined above, in the presence of phosphines, such as tris-(o-tolyl)phosphine or tri-t-butylphosphine in DMF and with NaHCO<sub>3</sub> or CsCO<sub>3</sub> as a base, to give compounds of
- 10 general formula I. In case mixtures of isomers are obtained these isomers can be separated by chromatography. Alternatively, compound III can be reacted with a corresponding acetylen derivative of formula CH≡C-R<sup>4</sup> (XIV) in a Sonogashira-type coupling with Pd(PPh<sub>3</sub>)<sub>4</sub>, CuI in triethylamine as base and solvent (for general procedure: K. Sonogashira in Synthesis, 1977 p 777) followed by reduction either via hydrogenation with Lindlar
- 15 catalyst in ethanol or benzene as solvent (for an analogous procedure: X. Huang, Synthesis 1995, p 769) or with sodium bis(2-methoxy)aluminium hydride (Red-Al) in a suited solvent such as THF (for a general procedure: M. F. Semmelhack, J. Org. Chem., 1975 p 3619).

Scheme 1

(b) Alternatively, according to scheme 1, compounds of general formula I can be obtained from compounds of type IV on reaction with appropriate aldehydes XII in acetic anhydride or propionic anhydride as a solvent, at elevated temperatures, in analogy to a procedure described by A. Fujita (Chem. Pharm Bull, 1965, p 1183).

(c) A further alternative summarized in scheme 2 consists of reacting a methyl hydroxypyrimidine of formula V with an appropriate aldehyde in an aldol-type condensation as above to yield compounds of formula VI. In cases where  $R^3$  is Me, either one of the Me groups reacts selectively with the aldehyde (depending on  $A^2$  and  $A^1$  definitions) or the mixtures obtained are separated by chromatography to give the compounds of general formula VI. The transformations to compounds of formula I can be achieved following a standard reaction sequence comprising halogenation with e.g.  $POCl_3$  (or  $POBr_3$ ) to give compounds of type VII and subsequent substitution with appropriate amines as described above.

Scheme 2

15

(d) A further alternative to prepare compounds of type I consists of reacting pyrimidinyl aldehydes of general type VIII with suited Wittig salts as outlined in scheme 3 or to condensate appropriately substituted Wittig salts of type IX with the corresponding aldehydes.

The compounds of formula IX can be obtained from VIII by standard transformation known in the art (reduction of the aldehyde, halogenation followed by Wittig salt formation). Depending on the reaction conditions mixtures of (E) and (Z) isomers can be obtained, which can be separated by chromatographic methods (e.g. preparative HPLC), or the thermodynamically more stable (E)- isomers 1a or the kinetically favoured (Z)- isomers 1b can be obtained as main products, receptively. Thus, for example, under 'salt

free' and 'high dilution' conditions in THF as solvent the (Z) isomer can be obtained selectively, whereas in the presence of lithium salts and under 'high concentration' conditions the (E) isomer can be obtained (for a general review: W. Carruthers: Some Modern Methods of Organic Synthesis, 2th Ed., Cambridge Texts in Chemistry and  
 5 Biochemistry, 1978 and: B. E. Maryanoff; J. Org. Chem. 1986, p 3302).

Scheme 3

R' means e.g. phenyl

#### Preparation of the intermediates:

The starting materials of general formula III are either known in the literature or can be obtained on application of classic methods of pyrimidine synthesis and subsequent  
 10 functional group conversion from amidines (or urea) and malonic acid derivatives as illustrated in scheme 4 - taking into account the definitions A<sup>2</sup> and A<sup>1</sup> and R<sup>3</sup>. Halogenation of the pyrimidine-diol intermediates X to provide compounds of general formula II can be accomplished with e.g. POCl<sub>3</sub> or POBr<sub>3</sub>, as described above.

Scheme 4

and wherein  $\text{R}''$  is e.g. alkyl

Alternatively, e.g. in case  $\text{R}^3$  is alkoxy or amino and  $\text{A}^2$  is CH and  $\text{A}^1$  is N compounds of general formula III can be obtained from 2,4, 6 tribromo pyrimidine (Langley et al. JACS, 1956 p. 2136) by sequential substitution reactions, followed by chromatographic separation in cases where mixtures of products are obtained -in analogy to methods described above and essentially known in the art.

Scheme 5

Compound of formula IV are essentially known in the literature (e.g. J. Org. Chem. 1987, p.1017), from which the pyrimidinyl aldehydes of formula VIII can be obtained by  
 5 oxydation, following general procedures as described in the literature: e.g. H. Yamanaka, Chem. Pharm. Bull, 1984, p 2005. Compounds of general formula V are either commercially available, described in the literature or easily obtained by standard procedures of pyrimidine synthesis, in analogy to sequences illustrated in scheme 4. Thus, from condensation of an amidine according to scheme 4 with alkyl acetoacetate there can  
 10 be obtained compounds of general formula V with A<sup>2</sup> is N, A<sup>1</sup> is CH. Compounds of formula V with (A<sup>2</sup> is CH, A<sup>1</sup> is N, R<sup>3</sup> is not alkoxy or amino) can be prepared as for X<sub>b</sub>, scheme 4, replacing urea with acetamidine and, in the cases where R<sup>3</sup> is alkoxy or amino, from methyl amidine and malonic ester (or alkyl cyanoacetate for R<sup>3</sup> is amino) in analogy to X<sub>a</sub>, scheme 4, followed by functional group transformations known in the literature.

15 In case a mixture of compounds according to formula Ia and Ib is obtained according to any one of the mentioned reactions separation is possible by methods known in the art such as chromatography.

#### Assay Procedures

##### 15 Cloning of mouse NPY5 receptor cDNAs:

The full-length cDNA encoding the mouse NPY5 (mNPY5) receptor was amplified from mouse brain cDNA using specific primers, designed based on the published sequence, and Pfu DNA-Polymerase (Stratagene). The amplification product was subcloned into the mammalian expression vector pcDNA3 using Eco RI and XhoI  
20 restriction sites. Positive clones were sequenced and one clone, encoding the published sequence was selected for generation of stable cell clones.

#### Stable transfection:

Human embryonic kidney 293 (HEK293) cells were transfected with 10 µg mNPY5  
25 DNA using the lipofectamine reagent (Gibco BRL) according to the manufacturer's instruction. Two days after transfection, geneticin selection (1 mg/ml) was initiated and several stable clones were isolated. One clone was further used for pharmacological characterization.

Radioligand competition binding:

Human embryonic kidney 293 cells (HEK293), expressing recombinant mouse NPY5-receptor (mNPY5) were broken by three freeze/thawing cycles in hypotonic Tris buffer (5 mM, pH 7.4, 1 mM MgCl<sub>2</sub>), homogenized and centrifuged at 72,000 x g for 15 min. The pellet was washed twice with 75 mM Tris buffer, pH 7.4, containing 25 mM MgCl<sub>2</sub> and 250 mM sucrose, 0.1 mM phenylmethylsulfonylfluoride and 0.1 mM 1,10-phenanthroline, resuspended in the same buffer and stored in aliquots at -80°C. Protein was determined according to the method of Lowry using bovine serum albumine (BSA) as a standard.

10

Radioligand competition binding assays were performed in 250 µl 25 mM Hepes buffer (pH 7.4, 2.5 mM CaCl<sub>2</sub>, 1 mM MgCl<sub>2</sub>, 1 % bovine serum albumine, and 0.01 % NaN<sub>3</sub> containing 5 µg protein, 100 pM [<sup>125</sup>I]labelled peptide YY (PYY) and 10 µL DMSO containing increasing amounts of unlabelled test compounds. After incubation for 1 h at 15 22°C, bound and free ligand are separated by filtration over glass fibre filters. Non specific binding is assessed in the presence of 1 µM unlabelled PYY. Specific binding is defined as the difference between total binding and non specific binding. IC<sub>50</sub> values are defined as the concentration of antagonist that displaces 50 % of the binding of [<sup>125</sup>I]labelled neuropeptide Y. It is determined by linear regression analysis after logit/log 20 transformation of the binding data.

Results obtained in the foregoing test using representative compounds of the invention as the test compounds are shown in the following table:

<u>Compound</u>	<u>IC<sub>50</sub></u>
20	18 nM
43	30 nM

Preferred compounds as described above have IC<sub>50</sub> values below 1000 nM; more 25 preferred compounds have IC<sub>50</sub> values below 100 nM, particularly below 10 nM. Most preferred compounds have IC<sub>50</sub> values below 1 nM. These results have been obtained by using the foregoing test.

However, the administration can also be effected parentally, such as intramuscularly or intravenously (e.g. in the form of injection solutions).

The compounds of formula I and their pharmaceutically usable salts and esters can be processed with pharmaceutically inert, inorganic or organic adjuvants for the production of tablets, coated tablets, dragées and hard gelatin capsules. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts etc. can be used, for example, as such adjuvants for tablets, dragées and hard gelatin capsules.

Suitable adjuvants for soft gelatin capsules, are, for example, vegetable oils, waxes, fats, semi-solid substances and liquid polyols, etc.

Suitable adjuvants for the production of solutions and syrups are, for example, water, polyols, saccharose, invert sugar, glucose, etc.

Suitable adjuvants for injection solutions are, for example, water, alcohols, polyols, glycerol, vegetable oils, etc.

Suitable adjuvants for suppositories are, for example, natural or hardened oils, waxes, fats, semi-solid or liquid polyols, etc.

Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, viscosity-increasing substances, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other therapeutically valuable substances.

In accordance with the invention the compounds of formula I and their pharmaceutically usable salts and esters can be used for the prophylaxis and treatment of arthritis, diabetes and particularly eating disorders and obesity. The dosage can vary in wide limits and will, of course, be fitted to the individual requirements in each particular case. In general, in the case of oral administration a daily dosage of about 0.1 mg to 20 mg per kg body weight, preferably about 0.5 mg to 4 mg per kg body weight (e.g. about 300 mg per person), divided into preferably 1-3 individual doses, which can consist, for

- 25 -

The invention is illustrated hereinafter by Examples, which have no limiting character.

### Examples

Preparation of the compounds of examples 1-11 can be achieved as follows:

5 General procedure for the condensation of 2,4-dimethyl-6-[dialkylamino]-  
pyrimidines with aromatic aldehydes:

A mixture of the pyrimidine derivative (1 mmol) and the aromatic aldehyde (1.0-1.5 mmol) was heated to reflux in propionic anhydride (0.4 ml) until the aldehyde had completely reacted (2-8 h). After cooling, the solution was diluted with ether, washed with  
10 2 M aqueous NaOH solution and brine, dried (MgSO<sub>4</sub>), and evaporated. The regioisomers were isolated by SiO<sub>2</sub> chromatography using a cyclohexane-ether gradient.

Accordingly there were prepared:

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 25

Present claim 25 relates to "the invention as hereinbefore described". The meaning of this claim is so obscure that a lack of clarity within the meaning of Article 6 PCT arises to such an extent as to render a meaningful search of the claims impossible. Consequently, the search has been carried out only for claims 1-24

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
